

PROJECT TESTING

Implement Client Script and UI Policy (Incident)

	Name	NM.Id

Team Members	Kalaiselvi S	asaluau020224128018
	Keerthana M	asaluau020224128020
	Kavitha V	asaluau020224128019
	Mageshwari R	asaluau020224128021

1. Testing Overview

The testing phase is carried out to verify that the implemented Client Script and UI Policy work correctly on the Service Now Incident form. The main purpose of testing is to ensure that the configured conditions, field behaviours, client-side validation, and form submission work as expected. Testing is performed using different Incident form scenarios to identify and correct any configuration or functional issues before the final validation.

2. Testing Objectives

The main objectives of the testing phase are:

- * To verify that the Client Script executes correctly.
- * To verify that the UI Policy conditions work correctly.
- * To check mandatory field behaviour.
- * To verify field visibility.
- * To verify read-only field behaviour.
- * To validate user input.
- * To ensure that valid Incident records can be submitted successfully.
- * To identify and correct configuration errors.

3. Client Script Testing

The Client Script is tested according to its configured event.

OnLoad Testing

The Incident form is opened and the initial field behaviour is checked.

Expected Result: The Client Script should execute when the Incident form loads and apply the required behaviour.

OnChange Testing

The relevant Incident field is changed to different values.

Expected Result: The Client Script should execute when the field value changes and apply the expected action.

OnSubmit Testing

An Incident is submitted with the required information.

Expected Result: The Client Script should validate the required conditions before allowing the Incident record to be submitted.

4. UI Policy Testing

The UI Policy is tested by changing the values related to its defined condition. The following field behaviours are verified:

Mandatory Field

When the condition is satisfied, the specified field should become mandatory.

Expected Result: The user should be required to enter the field value.

Visible Field

The field visibility is tested using the defined condition.

Expected Result: The field should become visible or hidden according to the UI Policy configuration.

Read-Only Field

The field is tested when the read-only condition is active.

Expected Result: The user should be able to view the field but should not be able to modify its value.

5. Test Cases

Test Case	Test Scenario	Expected Result	Status
TC01	Open Incident form	Client Script/UI Policy loads correctly	Pass
TC02	Change the specified field value	Client Script executes correctly	Pass
TC03	Condition becomes true	Required field behaviour is applied	Pass
TC04	Condition becomes false	Default field behaviour is restored	Pass
TC05	Required field is empty	Validation prevents incorrect submission	Pass
TC06	Required field is completed	Incident can be submitted	Pass
TC07	Read-only condition is applied	Field cannot be modified	Pass
TC08	Visibility condition is applied	Field is displayed/hidden correctly	Pass
TC09	Valid Incident information is entered	Record is saved successfully	Pass

6. Validation Testing

After completing the individual Client Script and UI Policy tests, the complete Incident form is tested as a combined process. The testing verifies that the Client Script and UI Policy do not conflict with each other. The complete flow is checked:

The system should provide the expected field behaviour throughout the process.

7. Error Identification and Correction

During testing, any unexpected behaviour is identified and reviewed. Common issues that may be checked include:

- * Incorrect field name.
- * Incorrect condition.
- * Incorrect Client Script type.
- * UI Policy not triggering.
- * Mandatory field not being applied.
- * Field remaining editable when it should be read-only.
- * Incorrect visibility behaviour.
- * Validation not working correctly.

After identifying an issue, the configuration is corrected and the test is repeated to confirm the solution.

8. Final Testing Result

The final testing confirms that the Client Script and UI Policy provide the expected dynamic behaviour on the Incident form. The configured fields respond correctly to the defined conditions, required information is validated, and valid Incident records can be submitted successfully. The testing results indicate that the implementation is ready for the final Validation and Documentation phase.

9. Conclusion

The Project Testing phase ensures that the Client Script and UI Policy implementation works correctly under different Incident scenarios. By testing field conditions, validation, visibility, mandatory status, read-only behaviour, and form submission, the reliability and consistency of the Incident form can be verified. Successful completion of testing confirms that the developed configuration meets the defined requirements and is ready for final validation.
